2-Layer Lake Model (according to Chapra 1997)

- (1) Epilimnion heat balance: $V_e \rho C_p \frac{dT_e}{dt} = Q \rho C_p T_{in} Q \rho C_p T_e \pm J A_s + v_t A_t \rho C_p (T_h T_e)$ (2) Hypolimnion heat balance: $V_h \rho C_p \frac{dT_e}{dt} = v_t A_t \rho C_p (T_e T_h)$

Putting surface heat flux into equation (1)

$$\frac{dT_{e}}{dt} = \frac{Q}{V_{e}}T_{in} - \frac{Q}{V_{e}}T_{e} + v_{t}\frac{A_{t}}{V_{e}}(T_{h} - T_{e}) + \frac{J_{sw}}{\rho C_{P}H} + \frac{\sigma(T_{air} + 273)^{4}(A + 0.031\sqrt{e_{air}})(1 - R_{L})}{\rho C_{P}H} - \frac{\epsilon\sigma(T_{e} + 273)^{4}}{\rho C_{P}H} - \frac{c_{t}f(U_{w})(T_{e} - T_{air})}{\rho C_{P}H} - \frac{f(U_{w})(e_{sat} - e_{air})}{\rho C_{P}H}$$

(4)
$$\frac{dT_h}{dt} = v_t \frac{A_t}{V_h} (Te - T_h)$$

with
$$H = \frac{A_s}{V_e}$$

Breaking down the units of the heat fluxes:

- (5) incoming shortwave radiation: $\frac{J_{sw}}{\rho C_P H} = \frac{cal * cm^2 * C}{cm^2 * d * cal} = \frac{C}{d}$ (6) incoming longwave radiation: $\frac{\sigma(T_{air} + 273)^4 (A + 0.031 \sqrt{e_{air}})(1 R_L)}{\rho C_P H} = \frac{cm^2 * C * cal * K^4}{cal * cal * cm^2 * d * K^4} = \frac{C}{d}$ (7) backscattering longwave radiation: $\frac{\epsilon \sigma(T_e + 273)^4}{\rho C_P H} = \frac{cm^2 * C * cal * K^4}{cal * cm^2 * d * K^4} = \frac{C}{d}$ (8) conduction: $\frac{c_1 f(U_W)(T_e T_{air})}{\rho C_P H} = \frac{cm^2 * C * C * m^2}{cal * C * s^2} = \frac{cm^4 * C}{cal * s^2}$ (9) evaporation: $\frac{f(U_w)(e_{sal} e_{air})}{\rho C_P H} = \frac{cm^2 * C * m^2}{cal * s^2} = \frac{cm^4 * C}{cal * s^2}$

Here:

 c_1 is Bowen's coefficient (=0.47 mmHg per deg C;

f(Uw) is a wind function, here by Brady, Graves and Geyer (1969): $f(Uw) = 19.0 + 0.95 * Uw^2$; e_{sat} and e_{air} are saturation vapor pressure and air vapor pressure in mmHG.
